 Moscow, Russia  +7(993)-931-04-70

EDUCATION

Physics and Mathematics Lyceum No. 31

Sept 2016 – Jun 2023

Prizewinner of regional and All-Russian Olympiads in Mathematics and Computer Science

Chelyabinsk, Russia

Higher School of Economics, Faculty of Computer Science

Sept 2023 – Present

Applied Mathematics and Computer Science, Bachelor's Program

Moscow, Russia

COURSES

School of Data Analysis — *Python* (Sept – Dec 2025), *Go* (Jan – Jun 2026)

T-Academy — *Software Development* (Sept 2025 – Jun 2026), *SRE* (Sept 2026 – Present)

EXPERIENCE

T-Bank Backend Developer

Mar 2026 – Present

Moscow, Russia

- Unified data schemas and set up synchronization between cloud providers, establishing a single source of truth and ensuring consistency of infrastructure information.
- Fixed critical bugs in the logic for determining resource owners and disk usage, ensuring accurate ownership reporting for billing.
- Set up automated monitoring of backup coverage by parsing reports from the backup solution, ensuring backup data remained up to date.

Yandex Backend Developer

Sept 2025 – Feb 2026

Moscow, Russia

- Designed and centrally rolled out a mechanism for tracking “stuck” tasks with automatic status transitions and TTL-based cleanup; ensured quality through unit tests and monitoring.
- Fixed critical bugs in Redis/S3 integrations, improving fault tolerance. Reworked database write logic, reducing redundant data volume and memory consumption.
- Wrote technical documentation for the team’s services, covering key endpoints and usage scenarios.

PROJECTS

Flight Booking • *Distributed booking system*

- Designed a two-microservice system with separate databases: Booking Service (REST, PostgreSQL) and Flight Service (gRPC, PostgreSQL + Redis cache), with inter-service communication over protobuf contracts.
- Implemented transactional seat booking, JWT authentication, and caching of hot flight data in Redis with invalidation.
- Ensured fault tolerance: retry logic, graceful degradation when Redis is unavailable, and idempotent booking operations.

USD/RUB Signal System • *ML-based market signal system*

- Built an ETL pipeline to collect data from MOEX ISS API (options, Si futures) and external sources: backfill into SQLite, IV computation via Black-Scholes and HV, and dataset construction.
- Trained a CatBoostRegressor to forecast changes in USD/RUB implied volatility; compared 3 target formulations via 8-fold walk-forward CV; the final model achieved 58.5% out-of-sample sign accuracy.
- Wrapped inference in a Telegram bot with morning/evening reports: IV forecast → exchange-rate range via Black-Scholes; deployed via Docker Compose.

SKILLS

- **Programming Languages:** Python, Go, C/C++, SQL, Bash
- **Technologies:** gRPC/protobuf, FastAPI, PostgreSQL, Redis, Docker, Docker Compose, K8s, Git, SSH
- **Languages:** Russian (native), English (A2+)
